

CLAIMS:

What is claimed is:

5 1. A method of managing energy in a processing system,
comprising:

receiving an indication of a need to reduce a energy usage
level in said processing system at a scheduler;

10 determining whether or not a next process to be scheduled
has an associated level of energy usage greater than a threshold;
and

selectively scheduling an execution slice for said next
process in response to determining that said associated level of
energy usage does not exceed said threshold.

15

2. The method of Claim 1, further comprising:

reading values of a plurality of performance counters during
one or more previous execution slices of said next process; and

20 estimating said associated level of energy usage in
conformity with said values of said plurality of performance
counters.

3. The method of Claim 1, further comprising:

25 measuring actual energy usage of said processing system
during or more previous execution slices of said next process;
and

estimating said associated level of energy usage in
conformity with said measured energy usage.

4. The method of Claim 1, further comprising:

second determining a resource usage of said next process;
and

estimating said associated level of energy usage in
5 conformity with said resource usage.

5. The method of Claim 4, further comprising receiving from an application owning said next process an indication of said resource usage, and wherein said second determining determines
10 said resource usage in conformity with said received indication.

6. The method of Claim 4, wherein said second determining is performed by said operating system by observing prior allocation of resources to said next process.

15

7. The method of Claim 1, further comprising:

issuing a pragmatic warning fault indicating that a system energy usage above a system energy threshold; and

20 second receiving said pragmatic warning fault at an application associated with said next process, and in response to said second receiving, reducing a resource usage within said application, whereby a energy usage of said next process is reduced.

25 8. The method of Claim 7, further comprising:

issuing a critical pragmatic fault indicating that said system energy usage has not been reduced below said system energy threshold; and

30 receiving said critical pragmatic fault at said scheduler, and wherein said selectively scheduling is performed in response to said receipt of said critical pragmatic fault by said scheduler.

9. The method of Claim 1, wherein said selectively scheduling inserts idle slices into an execution queue, whereby said energy usage level is reduced.
- 5 10. The method of Claim 1, wherein said selectively scheduling schedules a second process having a lower level of energy usage than said next process in preference over said next process.

11. A processing system, comprising: ✓
a processor;
a memory coupled to said processor for storing program
instructions and data values, and wherein said program
5 instructions comprise an operating system scheduler that includes
program instructions for
receiving an indication of a need to reduce a energy
usage level in said processing system at a scheduler,
determining whether or not a next process to be
10 scheduled has an associated level of energy usage greater
than a threshold, and
selectively scheduling an execution slice for said next
process in response to determining that said associated
level of energy usage does not exceed said threshold.

15

12. The processing system of Claim 11, wherein said program
instructions further comprise program instructions for:
reading values of a plurality of performance counters during
one or more previous execution slices of said next process; and
20 estimating said associated level of energy usage in
conformity with said values of said plurality of performance
counters.

13. The processing system of Claim 11, wherein said program
25 instructions further comprise program instructions for:
measuring actual energy usage of said processing system
during or more previous execution slices of said next process;
and
estimating said associated level of energy usage in
30 conformity with said measured energy usage.

14. The processing system of Claim 11, wherein said program instructions further comprise program instructions for:

second determining a resource usage of said next process;

and

5 estimating said associated level of energy usage in conformity with said resource usage.

15. The processing system of Claim 14, wherein said program instructions further comprise program instructions for receiving 10 from an application owning said next process an indication of said resource usage, and wherein said determining determines said resource usage in conformity with said received indication.

16. The processing system of Claim 14, wherein said program 15 instructions for second determining further comprise program instructions for observing prior allocation of resources to said next process.

17. The processing system of Claim 11, wherein said program 20 instructions further comprise program instructions for:

issuing a pragmatic warning fault indicating that a system energy usage above a system energy threshold; and

receiving said pragmatic warning fault at an application associated with said next process, and in response to said 25 receiving, reducing a resource usage within said application, whereby a energy usage of said next process is reduced.

18. The processing system of Claim 11, wherein said program instructions further comprise program instructions for:

issuing a critical pragmatic fault indicating that said system energy usage has not been reduced below said system energy
5 threshold; and

receiving said critical pragmatic fault at said scheduler, and wherein said selectively scheduling is performed in response to said receipt of said critical pragmatic fault by said scheduler.

10

19. The processing system of Claim 11, wherein said program instructions for selectively scheduling insert idle slices into an execution queue, whereby said energy usage level is reduced.

15 20. The processing system of Claim 11, wherein said program instructions for selectively scheduling schedule a second process having a lower level of energy usage than said next process in preference over said next process.

21. A computer program product comprising signal-bearing media encoding program instructions and data, wherein said program instructions comprise an operating system scheduler that includes program instructions for

5 receiving an indication of a need to reduce a energy usage level in said processing system at a scheduler,

determining whether or not a next process to be scheduled has an associated level of energy usage greater than a threshold, and

10 selectively scheduling an execution slice for said next process in response to determining that said associated level of energy usage does not exceed said threshold.

22. The computer program product of Claim 21, wherein said

15 program instructions further comprise program instructions for:

reading values of a plurality of performance counters during one or more previous execution slices of said next process; and

estimating said associated level of energy usage in conformity with said values of said plurality of performance 20 counters.

23. The computer program product of Claim 21, wherein said

program instructions further comprise program instructions for:

measuring actual energy usage of said processing system 25 during or more previous execution slices of said next process; and

estimating said associated level of energy usage in conformity with said measured energy usage.

24. The computer program product of Claim 21, wherein said program instructions further comprise program instructions for:
second determining a resource usage of said next process;
and

5 estimating said associated level of energy usage in conformity with said resource usage.

25. The computer program product of Claim 24, wherein said program instructions further comprise program instructions for
10 receiving from an application owning said next process an indication of said resource usage, and wherein said determining determines said resource usage in conformity with said received indication.

15 26. The computer program product of Claim 24, wherein said program instructions for second determining further comprise program instructions for observing prior allocation of resources to said next process.

20 27. The computer program product of Claim 21, wherein said program instructions further comprise program instructions for:
issuing a pragmatic warning fault indicating that a system energy usage above a system energy threshold; and
receiving said pragmatic warning fault at an application
25 associated with said next process, and in response to said receiving, reducing a resource usage within said application, whereby a energy usage of said next process is reduced.

28. The computer program product of Claim 21, wherein said program instructions further comprise program instructions for:

issuing a critical pragmatic fault indicating that said system energy usage has not been reduced below said system energy
5 threshold; and

receiving said critical pragmatic fault at said scheduler, and wherein said selectively scheduling is performed in response to said receipt of said critical pragmatic fault by said scheduler.

10

29. The computer program product of Claim 21, wherein said program instructions for selectively scheduling insert idle slices into an execution queue, whereby said energy usage level is reduced.

15

30. The computer program product of Claim 21, wherein said program instructions for selectively scheduling schedule a second process having a lower level of energy usage than said next process in preference over said next process.

20
